**Subject:** RE: TCEQ contractors have been activated

Here's the information I just recieved from EPA:

The ASPECT aircraft has already flown one sorty over West. The following is a preliminary review of the data. - shows the highest concentration of ammonia is about 600 feet downwind of the fire at 60 to 100 ppm. The direction of the plume is moving to the Northwest of the fire. Subsequent lines collected about 1/4 mile downwind are not detecting any ammonia.

EPA is sending their Mobile Command Post along with 2 On-Scene Coordinators and 8 contractors (with air monitoring equipment).
